

Database 2

Impex Tool Installation

- Copy the `impex-build.properties.sample` to your home directory as `impex-build.properties`
- Copy your JDBC driver into the location specified by the `drivers.directory` property, or change the value of that property
- Configure the `impex.*` properties for your local database (review the list below)

Unable to render {include} The included page could not be found.

Import the Data

- Point the `torque.schema.dir` property at `demo-data-set` directory from the distribution (which is the default in the sample file)
- Run the import process

```
ant import
```

The import process can take some time. (~30 minutes for MySQL - slightly longer on Oracle or on a remote database) It must convert a large amount of XML into SQL appropriate for your database platform. If you plan to use your computer during the process, you may want to set the parent process/thread priority lower than the default.
