

2.2 Framework Improvements

Ajax Improvements

Ajax Returns

Wrap content in a handler that indicates how the ajax call should handle the content. For example:

```
<div data-handler="update-title">  
  <div ..> title contents </div>  
</div>
```

An ajax return can have multiple handler actions. Others include:

update-pageErrors - Update the page errors div with nested content

update-page - Update page contents with nested content

update-component - Update component contents with nested content

update-view - Update entire view contents with nested content

show-lightbox - Show the nested contents in a lightbox

redirect - Perform a browser redirect to the new url

Handlers can have different parameters that are read, for example:

```
<div data-handler="update-component" data-componentId="u99">
```

```
<div data-handler="redirect" data-redirectUrl="http://kuali.org">
```
